1.0 INTRODUCTION

AirLabs Environmental Pty Ltd (AirLabs) was commissioned by Adelaide Brighton Cement Limited (ABC) to conduct an air quality assessment of the ABC Birkenhead Cement Plant (the facility) located in Birkenhead, South Australia.

This assessment is based on data obtained during source sampling undertaken by Airlabs during October 2014 (Airlabs Report OCT14181.2, issued on 16th January, 2015). The objective of this assessment is to numerically determine the air quality impacts beyond the facility's boundary. This is achieved by undertaking dispersion modelling.

This report presents a brief overview of the assessment methodology, an outline of the regulatory framework and a summary of the findings of the assessment.

2.0 SOURCE LOCATION AND DESCRIPTION

The Birkenhead facility manufactures cement used in the construction and mining industry. Based on previous modelling studies undertaken and Airlabs' knowledge of the facility, the main sources include the licenced Dry Process Kiln Stack (Stack 4A) and the Pre-Calciner Plant Stack (Stack 4B). Source parameters are discussed in the subsequent sections of this report.

3.0 **REGULATORY GUIDELINES**

3.1 National Legislation

In June 1988 (revised in 2003), the National Environment Protection Council (NEPC) developed the Ambient Air Quality National Environmental Protection Measure (NEPM) which set uniform standards for air quality at the national level and included ambient air quality standards for carbon monoxide, nitrogen dioxide, photochemical oxidants (as ozone), sulphur dioxide, lead and particulate matter with a nominal aerodynamic diameter of less than or equal to 10 microns (PM₁₀). The National Environmental Protection (Air Toxics) Measure (Air Toxics NEPM) includes standards for toxics such as Polycyclic Aromatic Hydrocarbons (PAHs).

3.2 South Australia Legislation

The South Australia EPA (EPA, 2006) specifies Design Ground Level Concentration (DGLC) criteria for the assessment of ground level concentrations of air pollutants for new developments and established facilities. The EPA also recognises the air quality standards set by National Environmental Protection Council under the National Environmental Protection (Ambient Air Quality) Measure (Air NEPM) and National Environmental Protection (Air Toxics) Measure (Air Toxics NEPM).

3.3 Summary of Air Criteria for the Project Goals

The air quality criteria adopted for the Project are summarised in **Table 1**.

Pollutant	Averaging Period	Criteria (µg/m³)	Source	Environmental Value				
Criteria Pollutants								
Nitrogen dioxide (NO ₂)	1 hour	113	EPA	Toxicity				
Sulfur dioxide (SO ₂)	1 hour	450	EPA	Toxicity				
Carbon monoxide (CO)	1 hour	29,000	EPA	Toxicity				
Particulate matter (PM ₁₀)	24 hours	50	Air NEPM	Health				
Metals, Metalloids and Metal Fumes								
Arsenic and compounds	3 minutes	0.17	EPA	International Agency for Research on Cancer (IARC) Group 1				
Antimony and compounds	3 minutes	17	EPA	Toxicity				
Barium	3 minutes	17	EPA	Toxicity				
Benzene	3 minutes	53	EPA	IARC Group 1 Carcinogen				
Beryllium and compounds	3 minutes	0.007	EPA	IARC Group 1 Carcinogen				
Cadmium and compounds	3 minutes	0.033	EPA	IARC Group 1 Carcinogen				

Table 1: Air Quality Criteria adopted for the Project

Report to Adelaide Brighton Cement Limited Air Quality Impact Assessment of the ABC Birkenhead Cement Facility

Pollutant	Averaging Period	Criteria (µg/m³)	Source	Environmental Value			
Chromium (III) compounds	3 minutes	17	EPA	Toxicity			
Chromium (VI) compounds	3 minutes	0.17	EPA	IARC Group 1 Carcinogen			
Copper	3 minutes	6.7	EPA	Toxicity			
Iron oxide	3 minutes	170	EPA	Toxicity

4.0 ASSESSMENT METHODOLOGY

In order to predict the impacts from 4A and 4B stacks, dispersion modelling has been used, details of which are presented in this section of the report.

4.1 Meteorological Modelling

Meteorological mechanisms govern the generation, dispersion, transformation and eventual removal of pollutants from the atmosphere. The local meteorology at the site plays a significant role in understanding the pollutant transport and dispersion mechanisms. For the project, the meteorological model – The Air Pollution Model (TAPM) (Version 4) was used to predict local meteorological data.

TAPM, developed by the Commonwealth Scientific and Industrial Research Organisation (CSIRO) is a prognostic model which is used to predict three-dimensional meteorological data and air pollution concentrations. The model predicts a time-series dataset comprising of parameters like wind speed, wind direction, temperature, pressure, water vapour, cloud, rain, mixing heights, atmospheric stability classes which are essential for dispersion modelling.

The software allows users to generate synthetic observations by referencing in-built databases (e.g. terrain information, synoptic scale meteorological observations, vegetation and soil type etc.) which are subsequently used in generating site-specific hourly meteorological observations.

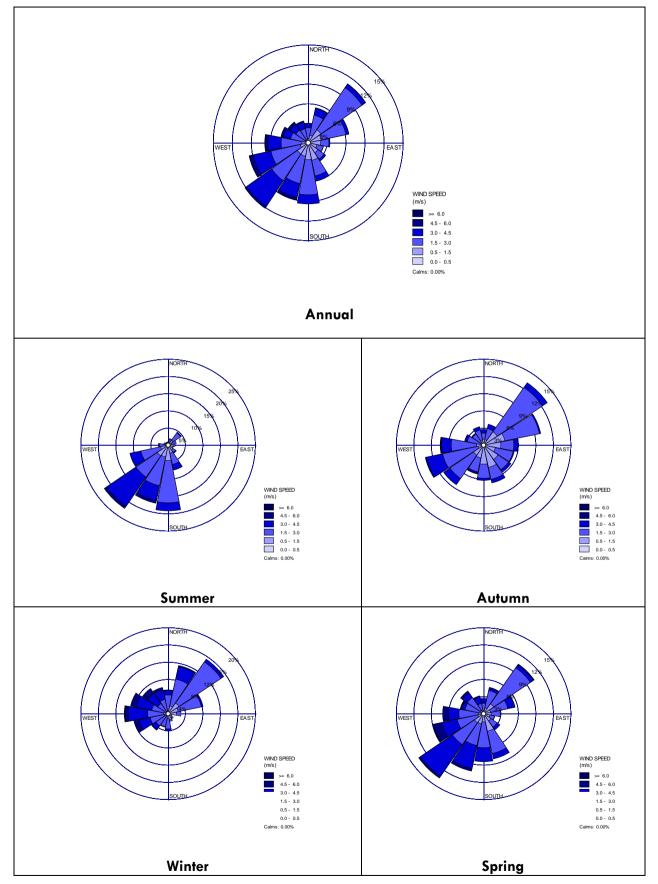

Details of the TAPM configuration for this Project are outlined in **Table 2**.

Parameter	Value
Year of Analysis	2013 (01/01/2013 to 31/12/2013)
Centre of Analysis (Easting, Northing) (m)	271384, 6142589 (UTM Zone 54 S)
Number of grids (spacing)	5 (30km, 10km, 3km, 1km, 0.3km)
Grid dimensions (nx, ny, nz)	25, 25, 25

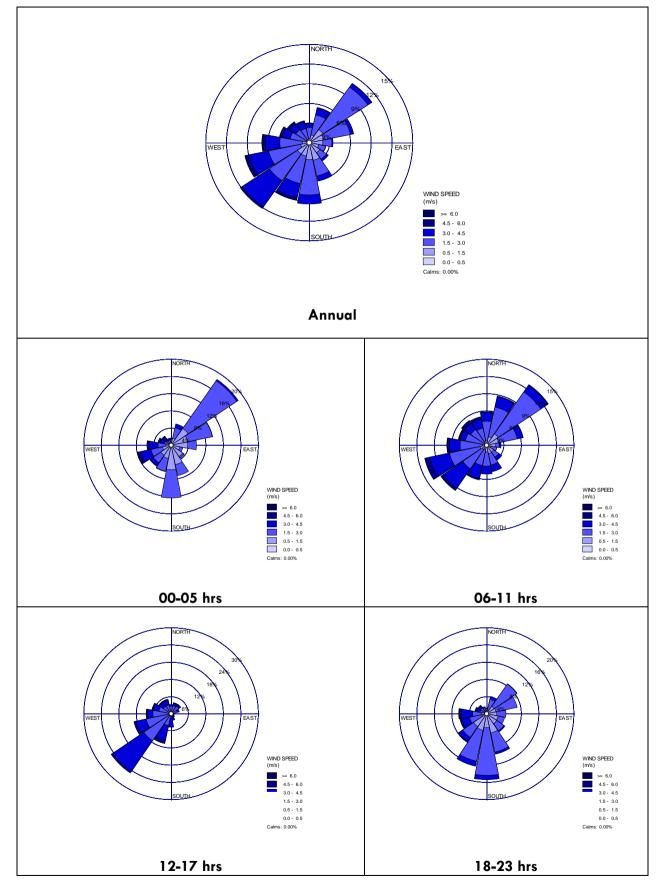

Table 2: TAPM Model Configuration for the Project

Meteorological information obtained from TAPM modelling is presented in the form of wind roses. Wind roses are a way of presenting a summary of wind speed and directional data for a particular time and location. Seasonal and diurnal wind roses along with Annual wind roses obtained from TAPM modelling are presented in **Figure 2** and **Figure 3**, respectively.

From the wind roses shown in Figure 2 and Figure 3, the following observations are made:

- Wind flow is predominantly from the south, south-westerly sectors;
- Light to moderate wind speeds (1.5 4.5 m/sec) are observed for most of the year;
- Distinct seasonal variation is observed, with the spring and summer seasons characterised by south, south-westerly flow whereas the wind flow is more scattered during the winter and autumn seasons;
- On a daily cycle, highest wind speeds are typically observed during the afternoon period (12 17 hrs) mainly from the south-westerly direction (Refer to **Appendix A** for seasonal and diurnal wind speed frequency distribution analyses); and
- Lowest wind speeds are typically observed during the evening periods (18 23 hrs).

4.2 Emission Rates and Source characteristics

Stack testing was conducted in October 2014 (Airlabs Report OCT14181.2, issued on 16th January, 2015) to sample the emission rates and source characteristics from Stacks 4A and 4B. Dispersion modelling parameters obtained from the stack testing undertaken in October 2014 are presented in **Table 3**.

Table 3: Stack Parameters (Stack 4A and Stack 4B)

Parameter	Stack 4A	Stack 4B	
Sampling Date	22 nd – 23 rd October 2014	23 rd – 24 th October 2014	
Stack height (m)	75.5	96	
Stack diameter (m)	3.23	3.0	
Stack temperature (°C)	102.6	105	
Exit velocity (m/s)	14.7	18.5	

Emission rates obtained from the sampling undertaken in October, 2014 and used in the dispersion modelling assessment are presented in **Table 4**.

	Emission Rates (g/s)			
Pollutant	Stack 4A	Stack 4B		
	(22 -23 October 2014)	(23- 24 October 2014)		
Criteria Pollutants	1			
Oxides of nitrogen (as NO ₂) - Minimum	11.8 (1)	1 2. 1 ⁽¹⁾		
Oxides of nitrogen (as NO ₂) - Average	13.8 (1)	13.4 (1)		
Oxides of nitrogen (as NO ₂) - Maximum	16.1 (1)	1 <i>5</i> .3 ⁽¹⁾		
Sulfur dioxide (SO ₂)	7.5 (2)	0.23		
Carbon monoxide (CO)	3.17	31		
Particulate matter (PM ₁₀)	2.15	0.57		
Metals, Metalloids and Metal Fumes				
Arsenic and compounds	0.00002	0.00001 (2)		
Antimony and compounds	0.00002	0.000014		
Barium	0.00023	0.00028		
Benzene	0.007 (2)	0.009		
Beryllium and compounds	0.00001 (2)	0.00001 (2)		
Cadmium and compounds	0.000055 (2)	0.000006 (2)		
Chromium (III) compounds	0.0003	0.0002		
Chromium (VI) compounds	0.00011	0.00002		
Copper oxide	0.0005	0.00014		
Iron oxide	0.05167	0.0233		
Lead	0.00085	0.00014		
Magnesium oxide fumes	0.01833	0.01		
Manganese and compounds	0.00057	0.0002		
Mercury - inorganic	0.000003	0.000001		
Mercury - organic	0.000163 (2)	0.0004		
Nickel and nickel compounds	0.00016	0.00011		
Zinc oxide	0.00583	0.00048		
Polycyclic Aromatic Hydrocarbons (PAH))			
PAH (as Benzo (a)pyrene)	0.000001	0.000001		
Acid Gases				
Hydrogen chloride	0.1 (2)	0.07		
Halogens	1	1		
Chlorine	0.003 (2)	0.0083 (2)		
-	0.003 (2)	0.003 (2)		
Fluoride	0.003 (2)	0.003 (2)		
· · · · · · · · · · · · · · · · · · ·	0.003 (2)	0.003 (2)		
Polychlorinated Dibenzo-p-Dioxins and I				
Dioxins and Furans (as TCDD I-TEQ)	1.1E-10	9.3E-11		

Table 4: Modelled Emission Rates (Stack 4A and Stack 4B)

Notes:

(1): It is to be noted that the modelled emission rates for nitrogen dioxide (NO₂) are 30% of the measured emissions rates for oxides of nitrogen (NO_{χ}) based on assumed photochemical NO_{χ} to NO₂ conversion rate of 30% (Katestone, 2012)

(2): Where the measured results were less than the detection limit, the detection limit was used for modelling purposes.

4.3 Dispersion Modelling

AUSPLUME (V6) dispersion model was used in conjunction with prognostic meteorological data obtained from TAPM for predicting impacts from Stack 4A and Stack 4B. AUSPLUME is a steady state Gaussian dispersion model, developed by the Victorian Environmental Protection Agency (Vic-EPA). Ground level concentrations at sensitive receivers in the surrounds of the facility were predicted based on stack parameters (**Table 3**) and stack emission rates (**Table 4**) and assessed for compliance by comparing the predicted ground level concentrations with the air quality criteria (**Table 1**).

Buildings in the vicinity of the sources play a major role in pollutant dispersion as they may create zones of strong turbulence and enhance downward mixing resulting in higher ground-level concentrations. For the Project, the building downwash effect from both the stacks were determined using the US Building Input Program – Plume Rise Model Enhancements (BPIP -PRIME) which is a utility program built into the AUSPLUME (V6) dispersion model. Results obtained from the dispersion modelling are presented in the following sections.

5.0 RESULTS AND DISCUSSION

Predicted ground level concentrations of all air pollutants from Stack 4A and Stack 4B are outlined in **Table 5**.

Pollutant	Averaging Period	Criteria (µg/m³)	Max Predicted Impacts Outside Facility Boundary		
	i choù	(µ9/11)	Conc. ⁽¹⁾ (µg/m³)	% of Criteria	
Criteria Pollutants					
Oxides of nitrogen (as NO ₂) – Minimum	1 hour	113	25	22%	
Oxides of nitrogen (as NO ₂) - Average	1 hour	113	29	26%	
Oxides of nitrogen (as NO ₂) - Maximum	1 hour	113	33	29%	
Sulfur dioxide (SO ₂)	1 hour	450	8	1.8%	
Carbon monoxide (CO)	1 hour	29000	36	0.1%	
Particulate matter (PM ₁₀)	24 hours	50	0.7	1.5%	
Metals, Metalloids and Metal Fumes					
Arsenic and compounds	3 minutes ⁽²⁾	0.17	0.0001	0.06%	
Antimony and compounds	3 minutes ⁽²⁾	17	0.0001	0.0006%	
Barium	3 minutes ⁽²⁾	17	0.002	0.0093%	
Benzene	3 minutes ⁽²⁾	53	0.05	0.09%	
Beryllium and compounds	3 minutes ⁽²⁾	0.007	0.0001	1%	
Cadmium and compounds	3 minutes ⁽²⁾	0.033	0.0002	0.6%	
Chromium (III) compounds	3 minutes ⁽²⁾	17	0.0015	0.009%	
Chromium (VI) compounds	3 minutes ⁽²⁾	0.17	0.0004	0.2%	

 Table 5: Dispersion Modelling Results from Stack 4A and Stack 4B

Pollutant	Averaging Period	Criteria (µg/m³)	Max Predicted Impacts Outside Facility Boundary		
	T CHOU	(µ9/11)	Conc. ⁽¹⁾ (µg/m³)	% of Criteria	
Copper oxide	3 minutes ⁽²⁾	6.7	0.002	0.029%	
Iron oxide	3 minutes ⁽²⁾	170	0.2	0.14%	
Lead	Annual	0.5	0.00008	0.015%	
Magnesium oxide fumes	3 minutes ⁽²⁾	330	0.1	0.026%	
Manganese and compounds	3 minutes ⁽²⁾	33	0.002	0.007%	
Mercury - inorganic	3 minutes ⁽²⁾	3.3	0.000012	0.0004%	
Mercury - organic	3 minutes ⁽²⁾	0.33	0.0017	0.5%	
Nickel and nickel compounds	3 minutes ⁽²⁾	0.33	0.001	0.25%	
Zinc oxide	3 minutes ⁽²⁾	170	0.02	0.011%	
Polycyclic Aromatic Hydrocarbons (PAH)				
PAH (as Benzo(a)pyrene)	Annual	0.0003	9.5E-08	0.03%	
Acid Gases		·			
Hydrogen chloride	3 minutes ⁽²⁾	250	0.5	0.2%	
Halogens					
Chlorine	3 minutes ⁽²⁾	100	0.036	0.036%	
	24 hours	2.9	0.002	0.1%	
Fluoride	7 days	1.7	0.001	0.1%	
	90 days	0.5	0.00079	0.2%	
Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans (PCDD and PCDF)					
Dioxins and Furans (as TCDD I-TEQ)	3 minutes ⁽²⁾	0.0000037	6.2E-10	0.017%	

Notes:

(1): The 99.9th percentile concentrations are reported as the maximum concentrations

(2): 3-minute average concentrations were estimated from predicted hourly averages using the CSIRO Peak to Mean Scaling approach

From the results outlined in **Table 5**, it is observed that ground level concentrations of all pollutants are well below their respective criteria. From all the modelled pollutants, highest concentrations were observed for NO₂, with their maximum 1-hour average concentrations predicted outside the facility boundary ranging from 22% to 29% of the air quality criteria for lower bound and upper bound emission rates, respectively.

As mentioned earlier, the NO₂ emissions were conservatively estimated by assuming that 30% of total NO_X emissions released would be converted to NO₂ (Katestone, 2012). For visual illustration, the highest 1-hour average NO₂ concentration isopleths for lower, average and upper bound emission rates are presented in **Figure 4**, **Figure 5** and **Figure 6**, respectively.

With respect to PM_{10} , It is to be noted that the 24-hour average concentrations have been conservatively determined by assuming that all the particulates released from Stack 4A and Stack 4B would be in the PM_{10} size range.

Figure 4: Predicted Maximum Ground Level Concentrations of NO₂ (µg/m³) (1 hour averaging period) based on lower bound of emission rates

Figure 6: Predicted Maximum Ground Level Concentrations of NO₂ (µg/m³) (1 hour averaging period) based on upper bound of emission rates

Please note that the coloured area in Figure 4 , Figure 5 and Figure 6, represent the Birkenhead Facility Precincts

6.0 CONCLUSIONS

The AUSPLUME (V6) Gaussian plume dispersion model, in conjunction with TAPM generated meteorological data, was used to predict the ground level concentrations of various air contaminants outside the boundaries of the Adelaide Brighton Cement facility in Birkenhead. Emission rates considered in this assessment were based on results from stack testing conducted by Airlabs Environmental on 22nd - 24th October, 2014 (Airlabs Report No. OCT14181.2, issued on 16th January, 2015).

Results from the dispersion modelling (**Table 5**) show that all the modelled pollutants are below their respective regulatory criteria, indicating that there were no air quality issues observed from the operation of Stacks 4A and 4B.
